undemiration (1124), Vector: pSport1; RNA was extracted from /note="Organ: Bye; Vector: pSport1; RNA was extracted from primary human pericytes in culture. A directionally cloned primary human pericytes in culture. A directionally cloned constructed at Bioserve Biotechnology (Laurel MD) essentially following the protocols of the SuperScript plasmid System full details of which are contained in the manufacturer's Instruction manual (http://www.lifetech.com/). First strand synthesis was carried out using a Not I primer-adapter (http://www.lifetech.com/). First carried out using a Not I primer-adapter (cond in Not I/Sal I sites. EST analysis was performed at the NIH Intramural Sequencing Center (NISC)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1404

Site 2: Xhol; The poly (A)+ RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including Sit site by treatment of T4 RNA ligase and the first strand cDNA was synthesized with Superscript II using Sfil oligo-dT primer. After first strand synthesis, RNA was degraded by NaOH treatment and cDNA was amplified by PCR reaction. The PCR products were digested with Sfil and cloned into DraIII - digested pMR185-FL3 vector. The obtained cDNA vectors were used for transformation of competent cells E. coll TOplOF, by electroporation method. The cDNA libraries constructed by this method are full-length enriched CDNA library."

The invention relates to diagnosing a neoplasm and inhibiting tumour growth in a mammal, using an antibody that binds to human separtyl growth in a mammal, using an antibody that binds to human separtyl contacting a tissue with a detectably-labelled antibody where an increase in level of antibody binding at tissue site compared to the level of binding to normal non-neoplastic tissue indicates the presence of a neoplasm at the tissue site. Inhibiting tumour growth in mammal involves administering the antibody conjugated to a cytotoxic agent to a mammal. Also included are a method of conferring an immune response to a tumour cell in a mammal, by administering the antibody, a method of inducing an HAAH-specific immune response in a mammal, by daministering the mammal an HAAH polypeptide (or a polynuclectide composition encoding the polypeptide, or its degenerate variant), a fragment of HAAH comprising an
                                                                                                                                                                                                                                                                                           Human; se; gene; aspartyl (asparaginyl) beta-hydoxylase; HAAH; cytostatic; immunostimulant; antibody; neoplasm; tumour; PB50; 86A; 5C7; 19B; brain tumour; glioma; glioblastoma; astrocytoma; haemangioma; pancreatic carcinoma; colon cancer; breast cancer; pancreatic cancer; liver cancer; cancer of the bile ducts; primary malignant CNS neoplasm; metastatic CNS neoplasm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ŏ
    Diagnosing neoplasm and inhibiting tumor growth, by contacting tissue mammal with detectably-labeled antibody which binds to human aspartyl (asparaginyl) beta-hydroxylase.
                                                                                                                                                                                                                                                                           Human cDNA encoding aspartyl (asparaginyl) beta-hydoxylase, HAAH.

cc antibody or its fragment which binds to HAAH (where the antibody is FB50, antibody or its fragment which binds to HAAH (where the antibody is FB50, CC 57 or 19B), a hybridoma cell line chosen from hybridoma FB50, HA386A, HA15CA and HA219B, and a fragment of HAAH which lacks enzymatic activity or alpha-ketoglutarate binding domain and epidermal growth cactivity or alpha-ketoglutarate binding domain and epidermal growth in a mammal, conferring an immune cr mammal, inhibiting tumour growth in a mammal, conferring an immune creaponse to a brain tumour cell (e.g. glioma, glioblastoma, astrocytoma or haemangioma) in a mammal, for conferring immune response in a mammal. The method is useful for diagnosing malignant creaplasms derived from endodermal tissue, e.g. colon cancer, breast cancer, pancreatic cancer, liver cancer and cancer of the bile ducts. The method is also useful for diagnosing neoplasms of central nervous system (CNS) e.g. primary malignant CNS neoplasms of both neuronal and glial cumours e.g. glioma, glioblastoma, and for diagnosing brain tumours e.g. glioma, glioblastoma, astrocytoma or haemangioma. The concert sequence encodes human HAAH astrocytoma or haemangioma.
                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    600
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AGACCCTGGAACCTGAAGTATCTCATGAAGAAACCGAGCATAGTTACCACGTGGAAGAGA 660
                                                                                                                                                                                   The present invention relates to a method for inhibiting tumour growth is a mammal. The method comprises administering to the mammal a compound, which inhibits the expression or enzymatic activity of a human aspartyl (asparaginyl) beta-hydroxylase (HAAH). The compound may inhibit HAAH hydroxylation of a NOTCH polypeptide. In particular, the compound may inhibit hydroxylation of an epidermal growth factor (EGF)-like repeat sequence in a NOTCH polypeptide. The methods are useful for inhibiting tumour growth or killing tumour cells, or for diagnosing or neoplasm is colon cancer. Deace, pancreatic cancer inhibiting cancer, breast cancer cancer of the bile ducts, or cancer or tumour of the central nervous system (CNS). The present sequence encodes HAAH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 GCTCCGGCAGCGGTAGCACGAGTGCGGCAGCAGCAGCCCCGGGGCCCCGGAGAGAAAAA

The invention relates to a novel isolated nucleic acid and the PRO polypeptide encoded by it. A protein of the invention has antiarinflammatory, antiarinflammatory activity. A polynucleotide of the invention may have a use in gene therapy. The PRO polypeptide, its of the invention may have a use in gene therapy. The PRO polypeptide, its polypeptide is useful for treating an immune related disorder such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, inventile chronic arthritis, a spondyloarthropathy, systemic sclerosis, an idiopathic inflammatory myopathy, Siparen's syndrome, systemic classes, a demoslinating disease of the central or peripheral nervous crowscultis, sarcoidosis, autoimmune haemolytic anaemic autoimmune chronic active hepatitis, primary disease, infectious or autoimmune chronic active hepatitis, primary disease, infectious or autoimmune chronic active hepatitis, primary disease, infectious or autoimmune chronic active hepatitis, primary disease, an autoimmune or immune-ensitive neteropathy, Mnipple's disease, arthma, allergic minutes, sclerosing chilary cirrhosis, granulomatous hepatitis, sclerosing chilary cirrhosis, primary disease, erythema multiforme, contact dermatitis, sociasis, an allergic disease, a bullous skin disease, erythema multiforme, contact dermatitis, psociasis, an allergic hypersensitivity, urticaria, an immune or immune-organicated disease, a bullous or contact disease, activity, urticaria, an immune organicated disease, graft rejection or contact disease, gr New PRO polypeptides and polynucleotides, useful for treating e.g. erythematosus, rheumatoid arthritis, diabetes mellitus, immune-mediated renal disease, or demyelinating diseases of the central or peripheral nervous system. Claim 1; SEQ ID NO 1092; 2940pp; English P-PSDB; ADP23915

This invention relates to novel agents that modulates the function of human apoptosis-associated proteins specified within the specification. Specifically, it refers to a method for the identification of target of genes whose expression is correlated with an early stage in the regulation of apoptosis. The present invention describes a method of contacting either candidate agents or control agents to the target genes and assessing the difference of binding and inhibitory activity, where the candidate agent is selected from a low molecular weight organic molecule, an antibody or fragment thereof, an antisense oligonucleotide, a small inhibitory daRNA, or a ribozyme. As such, the compositions and tecthods are useful for diagnosing and treating diseases or conditions associated with abnormal apoptosis in mammalian tissue, such as cancer, inflammation, autoimmune or neurodegenerative disorders. Accordingly, than exhibit cytostatic, antiinflammatory, immunosuppressive and neuroprotective activities. These may also be used for drug screening there are associated with the regulation of apoptosis that can be considered by the compositions are associated with the regulation of apoptosis that can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     426
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       486

                                                                                                                                                                                                                                                                   This invention relates to novel isolated cDNAs that are differentially expressed in MYCN activated cells. Specifically, it refers to expressed in MYCN activated cells. Specifically, it refers to polynucleotide sequences that exhibit differential expression patterns in cells activated by the transactivator MYCN, where MYCN is a protococate that is amplified in neuroblastoma cells and is common in small cell lung cancers. The present invention describes these cDNA molecules as useful for in hybridisation assays to detect expression of nucleic as useful for in hybridisation assays to detect expression of nucleic cells of complementary nucleic acids) in a present in a given sample, as useful for complementary nucleic acids) in a present in a given sample, so pecifically bind the cDNA as a ligand and modulate function or activity specifically bind the cDNA as a ligand and modulate function or activity. Accordingly, these compositions exhibit cytostatic activity and can also be used for gene therapy purposes. This polynucleotide sequence is a cDNA that is differentially expressed in MYCN activated cells, given in an exemplification of the invention. NOTHS: This sequence does not appear in the printed specification but has been obtained in electronic format from the USP patent Office at

The invention relates to new isolated nucleic acid molecule comprising a nucleic acid molecule consisting of a gene differentially expressed in cells undergoing differentiation from mesenchymal cell to a chondroblastic phenotype, or hybridiaing under stringent conditions to them for their fragments. Also included are expression vectors, to the induce differentiation of a mesenchymal cell and may be used as an immunogen ), binding partners of the polypeptides, a method for edentifying an agent useful in modulating mesenchymal cell and induction activity of a molecule, a method for a nucleic acid molecule or its expression product, a method for determining regression, progression or onset of cartilaginous tissue degeneration condition in a condition or onset of cartilaginous tissue degeneration condition in a cubject characterised by aberrant expression of a nucleic acid molecule or its expression product, a method for treating a cartilaginous tissue degeneration condition, a method for treating a cartilaginous tissue degeneration condition developing in the cubject, an emethod for treating a cartilaginous tissue degeneration condition and a solid-phase nucleic acid molecule array consisting essentially of a set of nucleic acid molecule array consisting essentially of a set of nucleic acid molecule array consisting essentially of a set of nucleic acid molecule as cited above (or known from known genes shown to be condition, and agents and agents at useful for treating cartilaginous tissue degeneration and infference analysis, RDA), its expression products or fragments, fixed to a solid substrate. The nucleic acids, polypeptides and agents are useful for treating cartilaginous tissue degeneration and as observables and agents are useful for treating cartilaginous tissue degeneration and as observables and agents are useful for treating cartilaginous conditions such as solid substrate. The nucleic acid degeneration conditions when as osteroarchinitis, the mucleic acid cubic arthritis, adjuvant arthritis defenments 
                                                                                                                                                                                                                                                                 New nucleic acid molecules capable of promoting chondrogenesis, useful for diagnoshing and treating cartilaginous tissue degeneration conditions, e.g. osteoarthritis, rheumatoid arthritis, gout arthritis, or osterochondrosis.
antiinflammatory; representational difference analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 CGGACCGTGCAATGGCCCAGCGTAAGAATGCCAAGAGCAGCGGCAACAGCAGCAGCAGCG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DB 6; Length 2680;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 2680 BP; 854 A; 446 C; 575 G; 805 T; 0 U; 0 Other;

```
The invention relates to a novel isolated nucleic acid and the PRO polypeptide encoded by it. A protein of the invention has antinflammatory, antiaarthritic, antinflammatory, antiaarthritic, antiallergic, antiaarthmatic, hepatotropic, and respiratory activity. A polynucleotide of the invention may have a use in gene therapy. The PRO polypeptide, its of the invention may have a use in gene therapy. The PRO polypeptide, its systemic upus erythematosus, rheumatoid arthritis, osteoarthritis, osteoarthritis, sarcoidosis, autoimmune related disorder such as systemic inflammatory myopathy, Sjogren's syndrome, systemic consolitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thromborytopenia, thyroiditis, diabetes mellitus, immune-mediated renal cisease, ademyelinating polyneuropathy, systemic system, idiopathic demyelinating polyneuropathy, a hepatopiliary cirrhosis, granulomatous hepatitis, socionable consoliary cirrhosis, granulomatous hepatitis, socionable consoliary, urticaria, an immune-mediated skin disease, asthma, allergic rhintis, atopic dermatitis, decorasis, an allergic chinitis, atopic dermatitis, contact dermatitis, contact dermatitis, contact dermatitis, pooriasis, an allergic rhintis, atopic dermatitis, contact contact dermatitis, contact dermatitis, contact dermatitis, atopic dermatitis, contact dermatitis, and protection or contect dermatical c
                                                                                                                                                                                                                                                                                                                               New PRO polypeptides and polynucleotides, useful for treating e.g. erythematosus, rheumatoid arthritis, diabetes mellitus, immune-mediated renal disease, or demyelinating diseases of the central or peripheral

This invention describes a novel polymucleotide and polypeptide sequence for the antigen detected by the antibody MCA 44-3A6. This antigen is designated Labyrinthin (Lab). Antibodies directed to the Labyrinthin and Labyrinthin (Lab). Antibodies directed to the Labyrinthin (Lab) protein are useful for the detection of Lab. The Lab protein is useful in diagnostic assays for cancer, e.g. to monitor the presence and amount of antibodies (this method is especially useful for cancer cells that have the Lab marker). As the Lab gene is not tissue-specific, it will detect cancer regardless of which organ it occurs in. Peptides cancers and/or to treat humans with cancer. Antibody MCA 44-3A6 is able to differentiate antigen associated with adenocarcinomas. However, the sequence of the antigen detected by this antibody as not been elucidated in the prior art. Determination of the polypeptide and polymucleotide sequence of this antigen would enhance its usefulness in cancer diagnosis, treatment and prevention. The present invention discloses the sequence of the antigen recognized by the MCA 44-3A6 antibody. This sequence concodes the human lab protein described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            46 GGAACTICATICTICACGIGGTIAIGGTGATIGCATIGCIGGGGGTCIGGGACATCTGIA 105

A composition a lung cancer in a patient. The polynucleotide and/or polypeptide is useful for treating a lung cancer in a patient. The polynucleotide is also useful for treating a probe or primer to detect the polynucleotide is also useful as probe or primer to detect the level of mRNA encoding a tumour protein. This sequence encodes a lung tumour associated protein or primer to described in the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the published_pot_sequences
